# Description

frames describe produces a summary of frames in memory or in a Stata frameset (.dtas) file.

## **Quick start**

Describe all frames in memory frames describe

Describe frames in file myframeset.dtas frames describe using myframeset

Describe variable var1 in frames A and B in memory frames describe var1, frames(A B)

### Menu

Data > Frames Manager

### Syntax

Describe frames in memory

```
frames describe [varlist] [, memory_options]
```

Describe frames in a file

```
frames describe [varlist] using filename [, file_options]
```

If *filename* is specified without an extension, .dtas is assumed. If *filename* contains embedded spaces or other special characters, enclose it in double quotes.

memory_options	Description
frames(framelist)	list of frames to describe
<u>si</u> mple	display only variable names
<u>s</u> hort	display only general information
<u>f</u> ullnames	do not abbreviate variable names
numbers	display variable number along with name
file_options	Description
frames(framelist)	list of frames to describe
<u>si</u> mple	display only variable names
<u>s</u> hort	display only general information

## Options

Options are presented under the following headings:

Options to describe frames in memory Options to describe frames in a file

#### Options to describe frames in memory

- frames (framelist) specifies the list of frames to describe.
- simple displays only the variable names in a compact format. simple may not be combined with other options, except for frames().
- short suppresses the specific information for each variable. Only the general information (number of observations, number of variables, and sort order) is displayed.
- fullnames specifies that frames describe display the full names of the variables. The default is to present an abbreviation when the variable name is longer than 15 characters. fullnames may not be specified with numbers.
- numbers specifies that frames describe present the variable number with the variable name. If numbers is specified, variable names are abbreviated when the name is longer than eight characters. numbers may not be specified with fullnames.

#### Options to describe frames in a file

frames (framelist) specifies the list of frames to describe.

- simple displays only the variable names in a compact format. simple may not be combined with other options, except for frames().
- short suppresses the specific information for each variable. Only the general information (number of observations, number of variables, and sort order) is displayed.

### **Remarks and examples**

#### stata.com

frames describe, with no operands, describes the frames in memory in alphabetical order.

frames describe with the using modifier describes frames on disk in the order they were specified in *framelist* when saved with frames save, frames(*framelist*). This ordering is reflected in stored result r(frames) after frames describe using.

Example 1: Describe frames in memory

After loading multiple datasets in memory with data frames, you can use frames describe to get a summary of the data in each frame. To demonstrate, below we create one frame with demographic information from the 1980 census (census.dta) and another with housing data (hsng.dta) from the same census.

clear frames
sysuse census
(1980 Census data by state)
frame rename default census
frame create housing
frame change housing
use https://www.stata-press.com/data/r18/hsng
(1980 Census housing data)

By simply typing frames describe, we get detailed information about the data in each frame, such as the number of observations and details about all the variables:

```
. frames describe
```

Observations Variables	s: s:	50 13		1980 Census data by state 6 Apr 2022 15:43

In the census data frame, we have information for each state about the median age and the numbers of children and teens, adults, and senior citizens. In the housing data frame, we have information about the housing units, median family income, and median housing value.

frames describe describes the frames in memory in alphabetical order. Therefore, we first get a summary of the census frame and then a summary of the housing frame. If we are interested only in certain variables, we can list them. Below, we describe the variables state and region, as well as all variables whose names begin with pop, for all frames in memory:

Frame: cens	us				
Variable	Storage	Display	Value		
name	type	format	label	Variable label	
state	str14	%-14s		State	
region	int	%-8.0g	cenreg	Census region	
pop	long	%12.0gc		Population	
poplt5	long	%12.0gc		Pop, < 5 year	
pop5_17	long	%12.0gc		Pop, 5 to 17 years	
pop18p	long	%12.0gc		Pop, 18 and older	
pop65p	long	%12.0gc		Pop, 65 and older	
popurban 	long	%12.0gc		Urban population	
Frame: hous	ing				
Variable	Storage	Display	Value		
name	type	format	label	Variable label	
state	str14	%14s		State	
region	int	%8.0g	region	Census region	
pop	long	%10.0g		Population in 1980	
popgrow	float	%6.1f		Pop. growth 1970-80	
popden	int	%6.1f		Pop/sq. mile	

. frames describe state region pop\*

Furthermore, if we are interested only in describing the data for certain frames, we can list the names with the frames() option. Below, we are interested in the population variables in the housing frame:

. frames describe pop\*, frames(housing)

Frame: hous	ing				
Variable name	Storage type	Display format	Value label	Variable label	
pop popgrow popden	long float int	%10.0g %6.1f %6.1f		Population in 1980 Pop. growth 1970-80 Pop/sq. mile	

We can also skip the variable information altogether with the short option:

. frames describe, frames(housing) short

Frame: housing		
Contains data from	https://www.stat	a-press.com/data/r18/hsng.dta
Observations:	50	1980 Census housing data
Variables:	12	3 Feb 2022 16:22
Sorted by: state		

4

#### Example 2: Describe frames in a file

In example 1, we created two frames with different information from the 1980 census. Let's save these frames into a file called censuses.dtas:

. frames save censuses, frames(housing census) replace (file censuses.dtas not found) file censuses.dtas saved

Now suppose that we are working in a new Stata session and we wish to describe the frames from the censuses.dtas file:

. clear all

. frames describe using censuses

Frame: hous:	ing			
Contains dat Observation Variable	ta ns: es:	50 12		1980 Census housing data 23 Mar 2023 16:16
Variable name	Storage type	Display format	Value label	Variable label
state	str14	%14s		State
division	int	%8.0g	division	Census division
region	int	%8.0g	region	Census region
рор	long	%10.0g	Ū.	Population in 1980
popgrow	float	%6.1f		Pop. growth 1970-80
popden	int	%6.1f		Pop/sq. mile
pcturban	float	%8.1f		Percent urban
faminc	long	%8.2f		Median family inc., 1979
hsng	long	%10.0g		Hsng units 1980
hsnggrow	float	%8.1f		% housing growth
hsngval	long	%9.2f		Median hsng value
rent	long	%6.2f		Median gross rent
Sorted by: s	state			

Frame: census				
Contains data Observations Variables	L :: ::	50 13		1980 Census data by state 23 Mar 2023 16:16
Variable name	Storage type	Display format	Value label	Variable label
state	str14	%-14s		State
state2	str2	%-2s		Two-letter state abbreviation
region	int	%-8.0g	cenreg	Census region
рор	long	%12.0gc		Population
poplt5	long	%12.0gc		Pop, < 5 year
pop5_17	long	%12.0gc		Pop, 5 to 17 years

marriage	long	%12.0gc		Number of marriages
divorce	long	%12.0gc		Number of divorces
Sorted by:				

Note that when we describe frames from a file, the first frame listed in the frames save command will be the first one described. Therefore, we now see the housing frame described first.

You can issue the return list command after frames describe using to see the order in which the frames were saved.

```
4
```

## **Stored results**

frames describe stores the following in r():

Scalars r(complevel)	compression level (with option using only)
Macros	
r(frames)	list of frames described
r(first)	first frame in r(frames) (with option using only)
r(N)	number of observations in each frame
r(k)	number of variables in each frame
r(width)	width of frames
r(changed)	1 or 0 for each frame in memory: 1 means the data in the frame have changed since last save; 0 means they have not changed
